

Projekt AMCANE – Increased Income and Food Security thanks to organic farming of peanuts and cashews

LED LIECHTENSTEIN
DEVELOPMENT
SERVICE

Short Project Description

Small farmers in northern Mozambique are among the poorest population groups in the country. Although they grow undemanding agricultural products such as peanuts and cashew nuts on their poor soils, the harvest is not very productive. The reasons for this are the nutrient-poor soil, little access to capital and technical resources, and lack of economic know-how. In order to secure a better income for the population of this region, the AMCANE project promotes the development of the peanut as well as the cashew and macadamia nut value chain.

Project Goals

- Smallholders increase productivity, quality and sales thanks to improved and sustainable production practices.
- Local and regional entrepreneurs increase demand for the products grown at fair prices.
- The various actors within the supply chain contribute to the development of inclusive standards and a better business environment.

Specifics of the Project

Thanks to the newly created value chain, stakeholders benefit from a better harvest, access to markets, organic quality products at fair prices, higher income and an improved food base.
